## Pioneers in Computing and Mathematics

The pioneers pictured below are featured in our Computing Needs All Voices lesson. To learn more about them and their contributions, visit <u>https://bit.ly/bootstrap-pioneers</u>.

We are in the process of expanding our collection of pioneers. If there's someone else whose work inspires you, please let us know at <a href="https://bit.ly/pioneer-suggestion">https://bit.ly/pioneer-suggestion</a>.

### **Notice and Wonder**

Write down what you Notice and Wonder from the <u>What Most Schools Don't Teach</u> video. "Notices" should be statements, not questions. What stood out to you? What do you remember? "Wonders" are questions.

What do you Notice?	What do you Wonder?

### Windows and Mirrors

Think about the images and stories you've just encountered. Identify something(s) that served as a mirror for you, connecting you with your own identity and experience of the world. Write about who or what you connected with and why.

Identify something(s) from the film or the posters that served as a window for you, giving you insight into other people's experiences or expanding your thinking in some way.

### **Reflection: Problem Solving Advantages of Diverse Teams**

This reflection is designed to follow reading LA Times Perspective: A solution to tech's lingering diversity problem? Try thinking about ketchup

1) The author argues that tech companies with diverse teams have an advantage. Why?

2) What suggestions did the article offer for tech companies looking to diversify their teams?

3) What is one thing of interest to you in the author's bio?

4) Think of a time when you had an idea that felt "out of the box". Did you share your idea? Why or why not?

5) Can you think of a time when someone else had a strategy or idea that you would never have thought of, but was interesting to you and/or pushed your thinking to a new level?

6) Based on your experience of exceptions to mainstream assumptions, propose another pair of questions that could be used in place of "Where do you keep your ketchup?" and "What would you reach for instead?"

## Introduction to Programming

The **Editor** is a software program we use to write Code. Our Editor allows us to experiment with Code on the right-hand side, in the **Interactions Area**. For Code that we want to *keep*, we can put it on the left-hand side in the **Definitions Area**. Clicking the "Run" button causes the computer to re-read everything in the Definitions Area and erase anything that was typed into the Interactions Area.

#### **Data Types**

Programming languages involve different data types, such as Numbers, Strings, Booleans, and even Images.

- Numbers are values like 1, 0.4, 1/3, and -8261.003.
  - Numbers are usually used for quantitative data and other values are usually used as categorical data.
  - In Pyret, any decimal *must* start with a 0. For example, 0.22 is valid, but .22 is not.
- Strings are values like "Emma", "Rosanna", "Jen and Ed", or even "08/28/1980".
  - All strings must be surrounded by quotation marks.
- Booleans are either true or false .

All values evaluate to themselves. The program 42 will evaluate to 42, the String "Hello" will evaluate to "Hello", and the Boolean false will evaluate to false.

#### Operators

Operators (like +, -, \*, <, etc.) work the same way in Pyret that they do in math.

- Operators are written between values, for example: 4 + 2.
- In Pyret, operators must always have spaces around them. 4 + 2 is valid, but 4+2 is not.
- If an expression has different operators, parentheses must be used to show order of operations. 4 + 2 + 6 and 4 + (2 \* 6) are valid, but 4 + 2 \* 6 is not.

#### **Applying Functions**

Applying functions works much the way it does in math. Every function has a name, takes some inputs, and produces some output. The function name is written first, followed by a list of *arguments* in parentheses.

- In math this could look like f(5) or g(10, 4).
- In Pyret, these examples would be written as f(5) and g(10, 4).
- Applying a function to make images would look like star(50, "solid", "red").
- There are many other functions, for example num-sqr, num-sqrt, triangle, square, string-repeat, etc.

Functions have contracts, which help explain how a function should be used. Every Contract has three parts:

- The Name of the function literally, what it's called.
- The Domain of the function what type(s) of value(s) the function consumes, and in what order.
- The *Range* of the function what *type of value* the function produces.

### **Strings and Numbers**

Make sure you've loaded <u>code.pyret.org (CPO)</u>, clicked "Run", and are working in the **Interactions Area** on the right. Hit Enter/return to evaluate expressions you test out.

#### Strings

String values are always in quotes.

- Try typing your name (in quotes!).
- Try typing a sentence like "I'm excited to learn to code!" (in quotes!).
- Try typing your name with the opening quote, but without the closing quote. Read the error message!
- Now try typing your name without any quotes. Read the error message!

1) Explain what you understand about how strings work in this programming language.

#### Numbers

2) Try typing 42 into the Interactions Area and hitting "Enter". Is 42 the same as "42" ? Why or why not?

3) What is the largest number the editor can handle?

4) Try typing 0.5. Then try typing .5. Then try clicking on the answer. Experiment with other decimals.

Explain what you understand about how decimals work in this programming language.

5) What happens if you try a fraction like 1/3 ?

6) Try writing **negative** integers, fractions and decimals. What do you learn?

#### **Operators**

7) Just like math, Pyret has *operators* like +, -, \* and /. Try typing in 4 + 2 and then 4+2 (without the spaces). What can you conclude from this?

8) Type in the following expressions, one at a time:  $4 + 2 \times 6$   $(4 + 2) \times 6$   $4 + (2 \times 6)$  What do you notice?

9) Try typing in 4 + "cat", and then "dog" + "cat". What can you conclude from this?

#### **Booleans**

#### Boolean-producing expressions are yes-or-no questions, and will always evaluate to either **true** ("yes") or **false** ("no").

What will the expressions below evaluate to? Write down your prediction, then type the code into the Interactions Area to see what it returns.

	Prediction	Result			Prediction	Result
1) 3 <= 4			2) "a" > "	b"		
3) 3 == 2			4) "a" < "	b"		
5) 2 < 4			6) "a" ==	"b"		
7) 5 >= 5			8) "a" <>	"a"		
9) 4 >= 6			10) "a" >=	"a"		
11) 3 <> 3			12) "a" <>	"b"		
13) 4 <> 3			14) "a" >=	"b"		
15) In your own words, describe what < does						
16) In your own words	s, describe what $\geq$ c	loes				
17) In your own words	s, describe what <> c	loes				
				Prediction	:	Result:
18) string-contai	ins("catnap", "c	at")				
19) string-contai	ins("cat", "catn	ap")				
20) In your own words returns true?	s, describe what stri	ing-contains doe	es. Can you gene	erate another expres	sionusing string-	contains that

★ There are infinite string values ("a", "aa", "aaa"...) and infinite number values out there (...-2,-1,0,-1,2...). But how many different *Boolean* values are there?

### **Applying Functions**

Open <u>code.pyret.org (CPO)</u> and click "Run". We will be working in the Interactions Area on the right.

Test out these two expressions and record what you learn below:

- regular-polygon(40, 6, "solid", "green")
- regular-polygon(80, 5, "outline", "dark-green")

1) You've seen data types like Numbers, Strings, and Booleans. What data type did the regular-polygon function produce?

2) How would you describe what a regular polygon is?

3) The regular-polygon function takes in four pieces of information (called arguments). Record what you know about them below.

	Data Type	Information it Contains
Argument 1		
Argument 2		
Argument 3		
Argument 4		

There are many other functions available to us in Pyret. We can describe them using *contracts*. The Contract for regular-polygon is: # regular-polygon :: Number, Number, String, String -> Image

- Each Contract begins with the function name: *in this case* regular-polygon
- Lists the data types required to satisfy its Domain: \_\_in this case Number, Number, String, String
- And then declares the data type of the Range it will return: <u>in this case Image</u>

Contracts can also be written with more detail, by annotating the Domain with variable names :

<pre># regular-polygon ::</pre>	( Number	, Number ,	String	, String	) -> Image
	size	number-of-sides	fill-style	color	_

4) We know that a square is a regular polygon because \_\_\_\_\_

5) What code would you write to make a big, blue square using the regular-polygon function?

function-name	(size :: Number	_,,,	fill-style :: String ''	) color :: String
6) Pyret also has a square function whose	e contract is:	<pre># square :: ( Number size</pre>	, <u>String</u> ,,	<u>String</u> ) -> Image
What code would you write to make a	big blue square u	sing the square function?		
function-name ( size :: Nu	imber	fill-style :: String color	) :: String	
7) Why does square need fewer argume	nts to make a squ	are than regular-polygor	ו?	

#### ★ Where else have you heard the word *contract* used before?

## Practicing Contracts: Domain & Range

Note: The contracts on this page are not defined in Pyret and cannot be tested in the editor.

is-beach-weather
Consider the following Contract: # is-beach-weather :: Number, String -> Boolean
1) What is the Name of this function?
2) How many arguments are in this function's <b>Domain</b> ?
3) What is the <b>Type</b> of this function's <b>first argument</b> ?
4) What is the <b>Type</b> of this function's <b>second argument</b> ?
5) What is the <b>Range</b> of this function?

6) Circle the expression below that shows the correct application of this function, based on its Contract.

- A. is-beach-weather(70, 90)
- B. is-beach-weather(80, 100, "cloudy")
- C. is-beach-weather("sunny", 90)
- D. is-beach-weather(90, "stormy weather")

#### cylinder

## Consider the following Contract: # cylinder :: Number, Number, String -> Image

7) What is the <b>Name</b> of this function?	
8) How many arguments are in this function's <b>Domain</b> ?	
9) What is the <b>Type</b> of this function's <b>first argument</b> ?	
10) What is the <b>Type</b> of this function's <b>second argument</b> ?	
11) What is the <b>Type</b> of this function's <b>third argument</b> ?	
12) What is the <b>Range</b> of this function?	

13) Circle the expression below that shows the correct application of this function, based on its Contract.

A. cylinder("red", 10, 60)

- B. cylinder(30, "green")
- C. cylinder(10, 25, "blue")
- D. cylinder(14, "orange", 25)

### Matching Expressions and Contracts

Match the Contract (left) with the expression described by the function being used (right). Note: The contracts on this page are not defined in Pyret and cannot be tested in the editor.

Contract		Francisco
Contract		Expression
# make-id :: String, Number → Image	e 1 A	<pre>make-id("Savannah", "Lopez", 32)</pre>
<pre># make-id :: String, Number, String -&gt; Image</pre>	e 2 B	<pre>make-id("Pilar", 17)</pre>
<pre># make-id :: String -&gt; Image</pre>	e 3 C	<pre>make-id("Akemi", 39, "red")</pre>
<pre># make-id :: String, String -&gt; Image</pre>	e 4 D	make-id("Raïssa", "McCracken")
<pre># make-id :: String, String, Number -&gt; Image</pre>	e 5 E	<pre>make-id("von Einsiedel")</pre>

Contract		Expression
<pre># is-capital :: String, String -&gt; Boolean</pre>	6 A	<pre>show-pop("Juneau", "AK", 31848)</pre>
# is-capital :: String, String, String -> Boolean	7 B	show-pop("San Juan", 395426)
<pre># show-pop :: String, Number -&gt; Image</pre>	8 C	is-capital("Accra", "Ghana")
<pre># show-pop :: String, String, Number -&gt; Image</pre>	9 D	show-pop( <b>3751351</b> , "Oklahoma")
<pre># show-pop :: Number, String -&gt; Number</pre>	10 E	<pre>is-capital("Albany", "NY", "USA")</pre>

## **Contracts for Image-Producing Functions**

Log into <u>code.pyret.org (CPO)</u> and click "Run". Experiment with each of the functions listed below in the interactions area. Try to find an expression that produces an image. Record the contract and example code for each function you are able to use!

Name	Domain	Range
triangle	:: Number, String, String	-> Image
triangle(80, "solid"	"darkgreen")	
# star		->
# circle	::	->
# rectangle	::	->
# text	::	->
# square		->
# rhombus	::	->
# ellipse	::	->
# regular-polygon	::	->
# right-triangle		->
# isosceles-triangle	::	->
# radial-star		->
# star-polygon		->
# triangle-sas		->
# triangle—asa	11	->

## **Catching Bugs when Making Triangles**

#### Learning about a Function through Error Messages

1) Type triangle into the Interactions Area of code.pyret.org (CPO) and hit "Enter". What do you learn?

2) We know that all functions will need an open parenthesis and at least one input! Type triangle(80) in the Interactions Area and hit Enter/return. Read the error message. What hint does it give us about how to use this function?

3) Using the hint from the error message, experiment until you can make a triangle. What is the contract for triangle?

#### What Kind of Error is it?

syntax errors - when the computer cannot make sense of the code because of unclosed strings, missing commas or parentheses, etc. contract errors - when the function isn't given what it needs (the wrong type or number of arguments are used)

4) In your own words, the difference between syntax errors and contract errors is:

#### Finding Mistakes with Error Messages

The following lines of code are all BUGGY! Read the code and the error messages below. See if you can find the mistake WITHOUT typing it into Pyret.

5) triangle(20, "solid" "red")
 Pyret didn't understand your program around
 triangle(20, "solid" "red")

This is a \_\_\_\_\_\_ error. The problem is that \_\_\_\_

6) triangle(20, "solid")

This <u>application expression</u> errored: **triangle**(20, "solid") <u>2 arguments</u> were passed to the <u>operator</u>. The <u>operator</u> evaluated to a function accepting 3 parameters. An <u>application expression</u> expects the number of parameters and <u>arguments</u> to be the same.

This is a \_\_\_\_\_\_ error. The problem is that \_\_\_\_

#### 7) triangle(20, 10, "solid", "red")

This <u>application expression</u> errored:

**triangle**(20, 10, "solid", "*red*")

<u>4 arguments</u> were passed to the <u>operator</u>. The <u>operator</u> evaluated to a function accepting 3 parameters. An <u>application expression</u> expects the number of parameters and <u>arguments</u> to be the same.

This is a \_\_\_\_\_\_ error. The problem is that \_\_\_\_\_\_

8) triangle (20, "solid", "red")

Pyret thinks this code is probably a function call: triangle (20, "solid", "red") Function calls must not have space between the <u>function expression</u> and the <u>arguments</u>.

This is a \_\_\_\_\_\_ error. The problem is that \_\_\_\_\_

# Using Contracts

Use the contracts to write expressions to generate images similar to those pictured. Go to <u>code.pyret.org (CPO)</u> to test your code.

<pre># ellipse :: ( Number width</pre>	
	Use the Contract to write an expression that generates a similar image:
	Use the Contract to write an expression that generates a similar image:
Write an expression using ellipse to produce a circle.	

	Number , <u>Number</u> , - side-length , number-of-sides	String ,	String ) →	> Image
	Use the Contract to w	ite an expression that	t generates a simi	lar image:
	Use the Contract to w	ite an expression that	t generates a simi	lar image:
Use regular-polygon to write an expression for a square!				
How would you describe a <b>regular polygon</b> to a friend?				

<pre># rhombus :: ( Numbe size</pre>	er , <u>Number</u> , <u>String</u> , <u>String</u> ) -> Image top-angle , fill-style , color
	Use the Contract to write an expression that generates a similar image:
	Use the Contract to write an expression that generates a similar image:
Write an expression to generate a rhombus that is a square!	

### **Triangle Contracts**

Respond to the questions. Go to <u>code.pyret.org (CPO)</u> to test your code.

1) What kind of triangle does the triangle function produce? \_\_\_\_\_\_ There are lots of other kinds of triangles! And Pyret has lots of other functions that make triangles!

```
# triangle :: (<u>Number</u>, <u>String</u>, <u>String</u>) -> Image
# right-triangle :: (<u>Number</u>, <u>Number</u>, <u>String</u>, <u>String</u>) -> Image
# isosceles-triangle :: (<u>Number</u>, <u>Number</u>, <u>String</u>, <u>String</u>) -> Image
angle
```

2) Why do you think triangle only needs one number, while right-triangle and isosceles-triangle need two numbers?

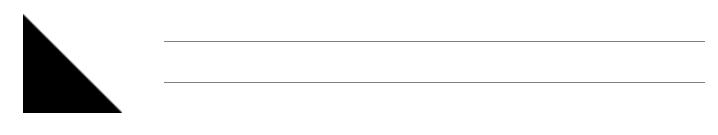

3) Write right-triangle expressions for the images below using 100 as one argument for each.

4) Write isosceles-triangle expressions for the images below using 100 as one argument for each.

5) Write 2 expressions that would build **right-isosceles** triangles. Use **right-triangle** for one expression and **isosceles-triangle** for the other expression.

6) Which do you like better? Why?

## **Radial Star**

# radial-star :: (_	Number points	, <u>Number</u>	, <u>Number</u> ,	, String,	
Using the Contract above	, match the images	s on the left to the exp		You can test the code	at <u>code.pyret.org (CPO)</u> .
	1	A	radial-star(	5, 200, 50, "so	lid", "black")
×	2	В	radial-star(	7, 200, 100, "so	olid", "black")
	3	С	radial-star(7	, <b>200, 100</b> , "ou	tline", "black")
•	4	D	radial-star(1	.0, 200, 150, "s	olid", "black")
	5	E	radial-star(	10, 200, 20, "so	olid", "black")
*	6	F	radial-star( <b>10</b>	10, 200, 20, "ou	tline", "black")
	7	G	radial-star( <b>10</b>	0, 200, 100, "ou	utline", "black")

### **Composing with Circles of Evaluation**

#### **Notice and Wonder**

Suppose we want to see the text "Diego" written vertically in yellow letters of size 150. Let's use Circles of Evaluation to look at the structure:

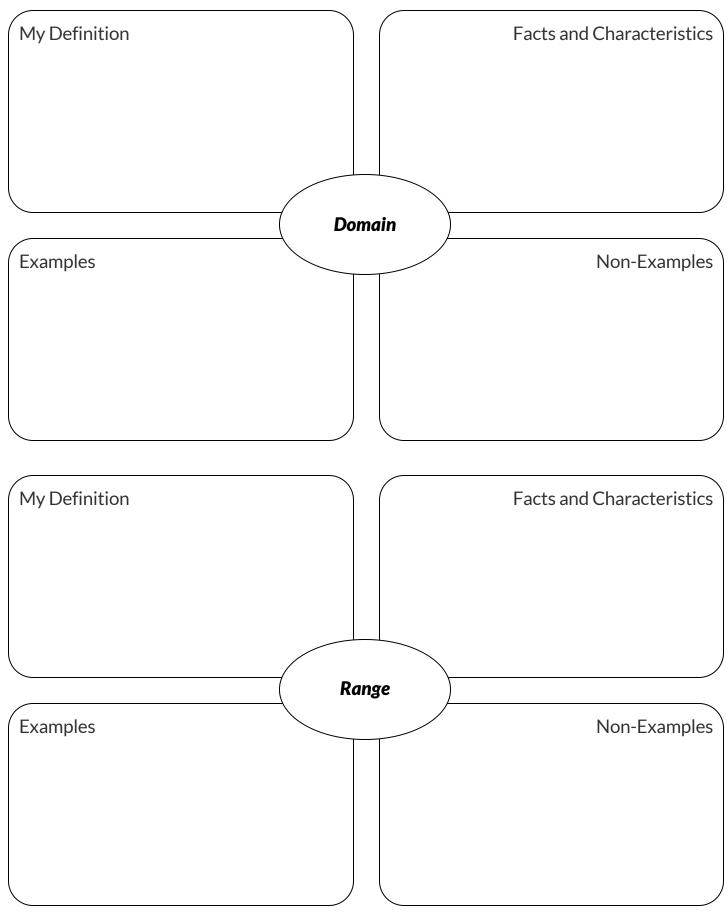

We can start by generating the Diego image.	And then use the rotate function to rotate it 90 degrees.
text "Diego" 150 "yellow"	<pre>potate 90 text "Diego" 150 "yellow"</pre>
<pre>text("Diego", 150, "yellow")</pre>	<pre>rotate(90, text("Diego", 150, "yellow"))</pre>
1) What do you Notice?	
2) What do you Wonder?	

#### Let's Rotate an Image of Your Name!

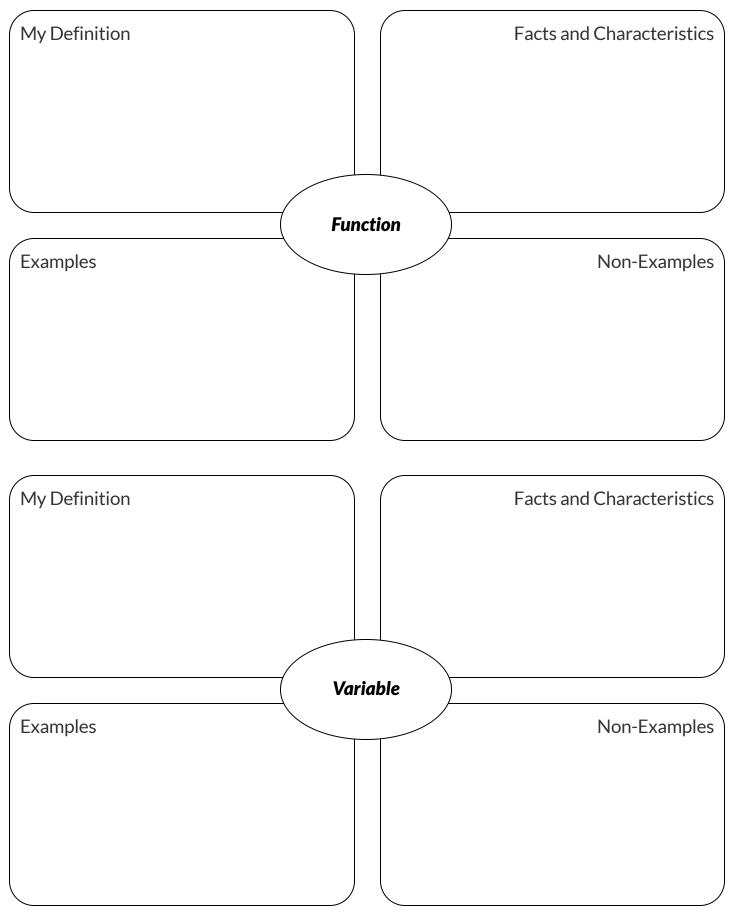

Suppose you wanted the computer to show your name in your favorite color and rotate it so that it's diagonal...

3) Draw the circle of evaluation to generate the image of your name in your favorite color.	4) Draw the circle of evaluation to rotate it so that it's diagonal.
5) Convert the Circle of Evaluation to code.	6) Convert the Circle of Evaluation to code.

## Frayer Model: Domain and Range

## Frayer Model: Function and Variable

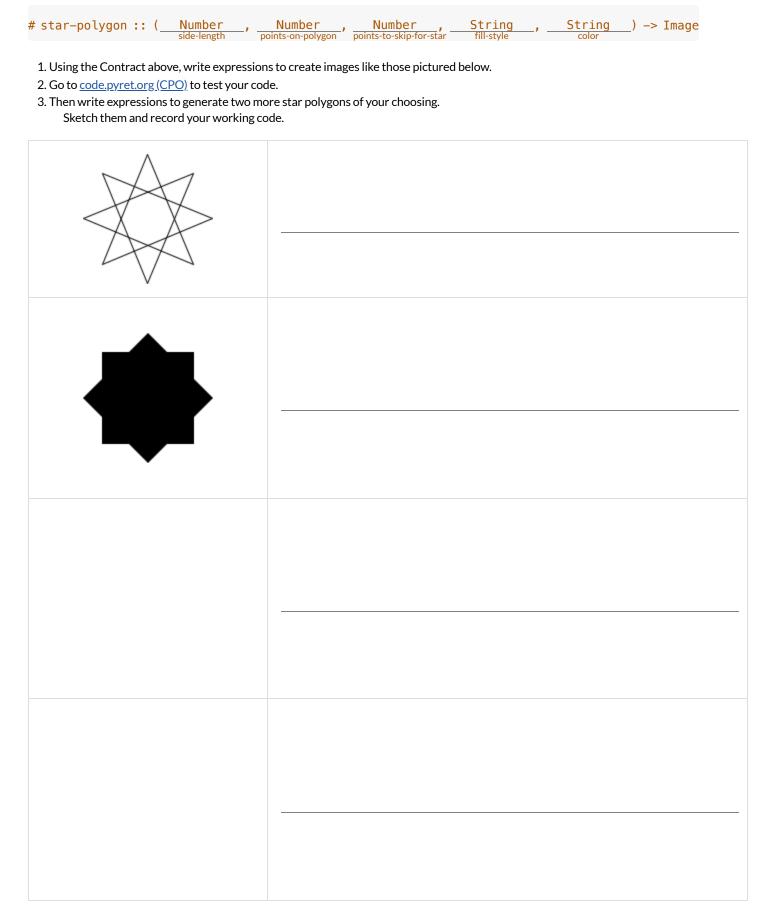

# Triangle Contracts (SAS & ASA)

Type each expression (left) below into the <u>code.pyret.org (CPO)</u> and match it to the image it creates (right).

Type each expression (left) below into the <u>code.pyret.org (CPO)</u> and match it Expression		Image	
triangle-sas(120, 45, 70, "solid", "black")	1	A	
<pre>triangle-sas(120, 90, 70, "solid", "black")</pre>	2	В	
triangle-sas( <b>120, 135, 70,</b> "solid", "black")	3	c	
<pre>triangle-sas(70, 135, 120, "solid", "black")</pre>	4	D	
<b>Contracts</b> Think about how you would describe each triangle-sas argument to se	omeone who'c	d never used the function before.	
5) Annotate the Contract below using descriptive variable names.			
triangle-sas :: ( <u>Number , Number , Number ,</u>	, <u>String</u>	, <u>String</u> ) -> Image	
If you have a printed workbook, add examples of each of the triangle functions we've explored to your contracts pages.			
★ If you have time, experiment with the triangle-asa function.			
<pre># triangle-asa :: (<u>Number</u>, <u>Number</u>, <u>Numbe</u> top-left-angle</pre>	<mark>r, St</mark> <sub>gle fi</sub>	tring, <u>String</u> ) -> Image ill-stylecolor	
★ Why did these two functions need to take in one more Number than right-triangle did?			

## **Star Polygon**

## Function Composition – Green Star

1) Draw a Circle of Evaluation and write the Code for a solid, green star, size 50. Then go to <u>code.pyret.org (CPO)</u> to test your code.

#### **Circle of Evaluation:**

#### Code:

Using the star described above as the **original**, draw the Circles of Evaluation and write the Code for each exercise below. Test your code in the editor.

2) A solid, green star, that is triple the size of the original (using scale)	3) A solid, green star, that is half the size of the original (using scale)
4) A solid, green star of size 50 that has been rotated 45 degrees counter-clockwise	5) A solid, green star that is 3 times the size of the original <b>and</b> has been rotated 45 degrees

### Function Composition – Your Name

You'll be investigating these functions with your partner: # text :: String, Number, String -> Image

#	flip-horizonta	ι:	:: Image -	-> Image
#	flip-vertical:	1	Image ->	Image

# frame :: Image -> Image # above :: Image, Image -> Image # beside :: Image, Image -> Image

1) In the editor, write the code to make an image of your name in big letters in a color of your choosing using text. Then draw the Circle of Evaluation and write the Code that will create the image. Circle of Evaluation for an "image of your name":

#### Code for an "image of your name":

Using the "image of your name" described above as the **original**, draw the Circles of Evaluation and write the Code for each exercise below. Test your ideas in the editor to make sure they work.

2) The framed "image of your name".	3) The "image of your name" flipped vertically.
4) The "image of your name" above a vertical reflection of the "image of your name"	5) The "image of your name" flipped horizontally beside "the image of your name".

## Function Composition – scale-xy

You'll be investigating these two functions with your partner:

<pre># scale-xy ::</pre>	( <u>Number</u> , <u>Number</u> , <u>Image</u> ) -> Image x-scale-factor y-scale-factor img-to-scale	<pre># overlay :: (<u>Image</u>, <u>Image</u>) -&gt; Image</pre>
The Image:	Circle of Evaluation:	Code:
$\blacklozenge$	rhombus 40 90 "solid" "purple"	<pre>rhombus(40, 90, "solid", "purple")</pre>

#### Starting with the image described above, write Circles of Evaluation and Code for each exercise below. Be sure to test your code!

1) A purple rhombus that is stretched 4 times as wide.	2) A purple rhombus that is stretched 4 times as tall
3) The tall rhombus from #1 overlayed on the wide rhombus (#2).	
5) The tail hombus hom #1 overlayed on the wide hombus (#2).	
$\star$ Overlay a red rhombus onto the last image you made in #3.	

What If you	What image will each of the four expressions below evaluate to? If you're not sure, go to code.pyretorg (CPO) and type them into the l	What image will each of the four expressions below evaluate to? If you're not sure, go to code pyretorg (CPO) and type them into the Interactions Area and see if you can figure out how the code constructs its image.
be sc	<pre>beside(rectangle(200, 100, "solid", "black"), scale-xy(1, 2, square(100, "solid", "black"))</pre>	solid", "black"), square(100, "solid", "black")) solid", "black"))
ab	scale(z, rectangle(100, 100, "solid", "black")) above( rectangle(100, 50, "solid", "black"),	"solia", "black")) d", "black"),
	above( rectangle(200, 100, "solid", "black"), rectangle(100, 50, "solid", "black")))	"solid", "black")) solid", "black")))

More than one way to Compose an Image!

### **Function Cards**

Print and cut these out, for use with the unplugged "function composition" activity.

<pre># double :: Number -&gt; Number # consumes a number, and multiplies that number by 2</pre>	<pre># half :: Number -&gt; Number # consumes a number, and produces a number that is half the input</pre>
<pre># add5 :: Number -&gt; Number # consumes a number, adds five, and produces the result</pre>	<pre># sub10 :: Number -&gt; Number # consumes a number, subtracts ten, and produces the result</pre>
<pre># num-sqr :: Number -&gt; Number # consumes a number, squares it, and produces the result</pre>	<pre># neg :: Number -&gt; Number # consumes a number, multiplies it by -1, and produces the result</pre>
<pre># add1 :: Number -&gt; Number # consumes a number, adds one, and produces the result</pre>	<pre># f :: Number -&gt; Number # consumes a number, subtracts seven, and produces the result</pre>
<pre># g :: Number -&gt; Number # consumes a number, adds six, and produces the result</pre>	<pre># h :: Number -&gt; Number # consumes a number, subtracts one, and produces the result</pre>

### **Defining Values**

In math, we use values, expressions and definitions.

- Values include things like:  $-98.1 \quad \frac{2}{3} \quad 42$
- Expressions include things like:  $1 imes 3 = \sqrt{16} = 5 2$ 
  - These evaluate to results, and typing any of them in as code produces some answer.
- **Definitions** are different from values and expressions, because *they do not produce results*. Instead, they simply create names for values, so that those names can be re-used to make the Math simpler and more efficient.
  - Definitions always have both a name and an expression.
  - The name goes on the left and is defined by an equals sign to be the result of a value-producing expression on the right: x = 4y = 9 + x
  - The above examples tells us: "x is defined to be 4." "y is defined to be 13."
  - Important: there is no "answer" to a definition, and typing in a definition as code will produce no result.
  - Notice that once a value has been defined, it can be used in subsequent definitions. In the example above... The definition of y refers to x.

The definition of x, on the other hand, *cannot* refer to y, because it comes before y is defined.

In Pyret, definitions are written the exact same way !

- Try typing these definitions into the Definitions Area on the left, clicking "Run", and then using them in the Interactions Area on the right.
   x = 4
  - y = 9 + x

Just like in math, definitions in our programming language can only refer to previously-defined values.

- Here are a few more value definitions. Feel free to type them in, and make sure you understand them.

  - y = x \* 7
  - food = "Pizza!"
  - o dot = circle(y, "solid", "red")

#### **Defining Values - Explore**

Open the Defining Values Starter File and click "Run".

1) What do you Notice?

#### 2) What do you Wonder?

For each of the expressions listed below, write your *prediction* for what you expect Pyret to produce? Once you have completed your predictions, test them out one at a time in the Interactions Area.

	Prediction	Result		Prediction	Result
3) ×			4) × + 5		
5) y - 9			6) x * y		
7) z			8) t		
9) gold-star			10) my-name		
11) swamp			12) c		

13) In the code, find the definitions of exampleA, exampleB, and exampleC. These all define the same shape, but their definitions are split across several lines. Suppose you *had* to split your code across multiple lines like this. Which one of these is the easiest to read, and why?

14) Define at least 2 more variables in the Definitions Area, click "Run" and test them out. Once you know they're working, record the code you used below.

15) What have you learned about defining values?

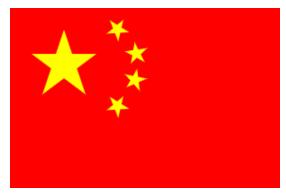

# Which Value(s) Would it Make Sense to Define?

For each of the images below, identify which element(s) you would want to define before writing code to compose the image. *Hint: what gets repeated?* 

#### **Chinese Flag**

The image value on the left called china is defined by the code on the right.

1) What image do you see repeated in the flag?

2) **Highlight or underline** every place in the code **that you see the repeated expression for that image.** 

```
china =
  put-image(
    rotate(40,star(15,"solid","yellow")),
    120, 175,
    put-image(
      rotate(80,star(15,"solid","yellow")),
      140, 150,
      put-image(
        rotate(60,star(15,"solid","yellow")),
        140, 120,
        put-image(
          rotate(40,star(15,"solid","yellow")),
          120, 90,
          put-image(scale(3,star(15,"solid","yellow")),
            60, 140,
            rectangle(300, 200, "solid", "red"))))))
```

3) Write the code to define a value for the repeated expression.

4) Open the <u>Flag of China Starter File</u>, **save a copy** and click "Run". **Simplify the code**, replacing the repeated expressions with the value you defined. Do you still get the same image when you click "Run"? If not, check your work.

5) Change the color of all the stars to black, then change their size to 20. Would this have been easier with the original code? Why or why not?

#### 6) Here is the same code shown above, but all crammed into one line.

```
china = put-image(rotate(40, star(15, "solid", "yellow")), 120, 175, put-image(rotate(80, star(15,
"solid", "yellow")), 140, 150, put-image(rotate(60, star(15, "solid", "yellow")), 140, 120, put-
image(rotate(40, star(15, "solid", "yellow")), 120, 90, put-image(scale(3, star(15, "solid",
"yellow")), 60, 140, rectangle(300, 200, "solid", "red"))))))
```

Is it easier or harder to read, when everything is all on one line?

7) Professional programmers *indent* their code, by breaking long lines into shorter, more readable lines of code. In the indented code at the top of the page, notice that each <u>put-image</u> is followed by several lines of code that all line up with each other, and that the lines under the *next* <u>put-image</u> are shifted farther and farther to the right. What do you think is going on?

★ This file uses a function we haven't seen before! What is its name? \_\_\_\_\_\_\_ Hint: Focus on the last instance of the function.

How many inputs are in its domain? \_\_\_\_\_. What are the types of those inputs? \_\_\_\_\_

Why Define Values?

Take a close look at the Original Circle of Evaluation & Code and how it got simplified.

1) Write the code that must have been used to define the value of || sunny . \_

2) Complete the table using the first row as an example.

Original Circle of Evaluation & Code	Î	Use the <i>defined value</i> sunny to simplify!
3 radial-star 30 20 50 "solid" "yellow"	Ŷ	scale 3 sunny
scale(3, radial-star(30, 20, 50, "solid", "yellow"))	¢	Code: scale(3, sunny)
Second Circle of Evaluation & Code	¢	Use the <i>defined value</i> sunny to simplify!
frame radial-star 30 20 50 "solid" "yellow"	Ŷ	
<pre>frame(radial-star(30, 20, 50, "solid", "yellow"))</pre>	Ť	Code:
Third Circle of Evaluation & Code	Î	Use the <i>defined value</i> sunny to simplify!
textoverlay"sun" 30 "black"30 20 50 "solid" "yellow"	1	
overlay(text("sun", 30, "black"), radial-star(30, 20, 50, "solid", "yellow"))	Ŷ	Code:
2) Define the terms in the Definitions Area university and an and the terms of the second		

Define sunny in the Definitions Area using the code you recorded at the top of the page.
 Test your code in the editor and make sure it produces what you would expect it to.

# Writing Code using Defined Values

1) On the line below, write the Code to define PRIZE-STAR as the pink outline of a size 65 star.

Using the PRIZE-STAR definition from above, draw the Circle of Eva Be sure to test out your code in <u>code.pyret.org (CPO)</u> before moving or	
2 The outline of a pink star that is three times the size of the original (using scale) Circle of Evaluation:	3 The outline of a pink star that is half the size of the original (using scale ) Circle of Evaluation:
Code:	Code:
4 The outline of a pink star that is rotated 45 degrees (It should be the same size as the original.) Circle of Evaluation:	5 The outline of a pink star that is three times as big as the original and has been rotated 45 degrees Circle of Evaluation:
Code:	Code:

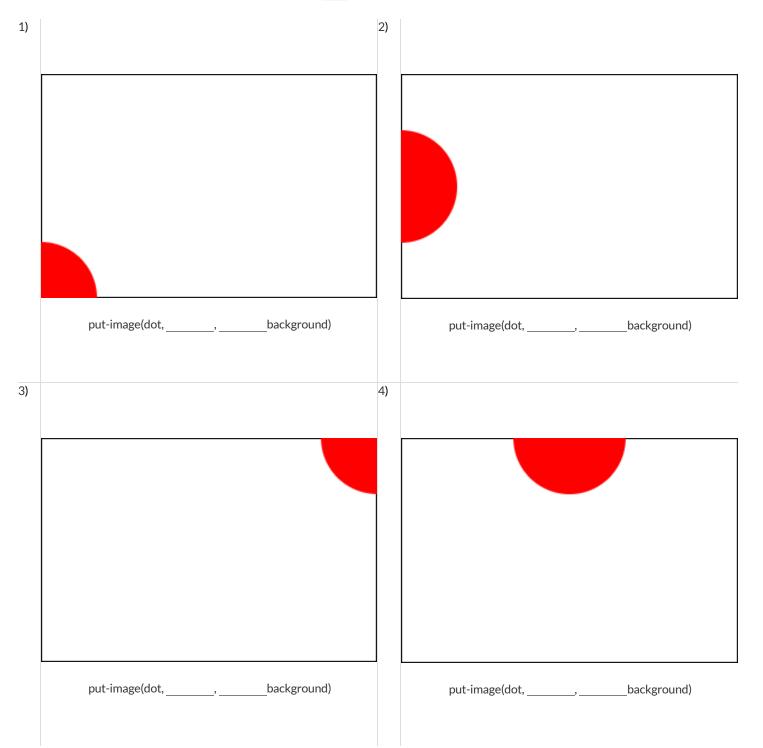

6) How does defining values help you as a programmer?

### Making Sense of Coordinates

dot = circle(50, "solid", "red")
background = rectangle(300, 200, "outline", "black")

Think of the background image as a sheet of graph paper with the origin (0,0) in the bottom left corner. The width of the rectangle is 300 and the height is 200. The numbers in put-image specify a point on that graph paper, where the center of the top image (in this case dot) should be placed.

What coordinates would you expect were used to place the dot for each of the following images?

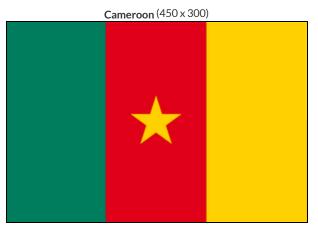

# Investigating put-image

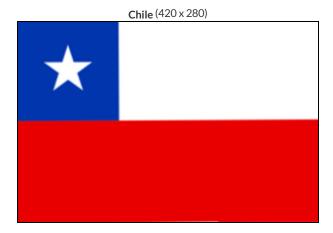

Japan For this section of the page, you will refer to the <u>Flags Starter File</u> .
1) Each language has its own symbol for commenting code so that programmers can leave notes that won't be read by the computer. In Pyret,
we use the hash mark ( # ). What color are comments in Pyret?
2) Type japan-flag into the Interactions Area. What do you get back?
3) Type japan into the Interactions Area and compare the image to japan-flag.
How are they alike?
How are they different?
4) japan is composed using dot and background. Type each of those variables into the Interactions Area. What do you get back?
• dot:
background:
5) These images are combined using the put-image function. What is its contract?
6) Fix the japan code so that it matches the japan-flag image. What did you need to change?
7) How can you prove that you have placed the dot in exactly the right location?
The Netherlands
For this section of the page, you will refer to the <u>Flags of Netherlands, France &amp; Mauritius Starter File</u> .
8) What was the programmer thinking when she coded the height of the red stripe as 200 / 3?
9) The center of the blue stripe is placed at ( 150 , 200 $/$ 6 ). How did the programmer know to use 150 as the x-coordinate?
10) What was the programmer thinking when she coded the y-coordinate as 200 / 6 ?
11) Explain the thinking behind coding the red stripe's y-coordinate as $5 \times (200 / 6)$ .
12) What advantages are there to representing height, length, or width as fractions (as the coder did here) rather than computing and using the value?

## **Decomposing Flags**

Each of the flags below is shown with their width and height. Identify the shapes that make up each flag. Use the flag's dimensions to estimate the dimensions of the different shapes. Then estimate the x and y coordinates for the point at which the center of each shape should be located on the flag. *Hint: The bottom left corner of each flag is at (0,0) and the top right corner is given by the flags dimensions.* 

shape:	color:	width:	height:	х	У

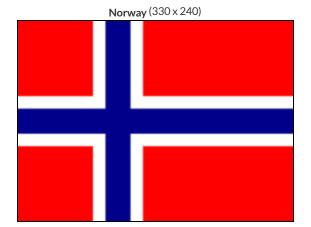

shape:	color:	width:	height:	х	У

shape:	color:	width:	height:	х	У

shape:	color:	width:	height:	х	У

# Coding and Designing the Alaskan Flag

Open the Flag of Alaska Starter File. Click run and type "alaska" to see an image of the flag of Alaska.

### **Exploring the Code**

1) How many images are defined in the code?

2) How many images are placed using put-image in order to generate the flag?

3) Why do your answers to these questions differ?

4) The code for the flag could have been written without defining any images. What are some reasons why defining images makes the code easier to work with?

### The Story of the Flag of Alaska

Benny Benson holding the flag of Alaska that he designed

The Alaska state flag is based on a design created in 1926 for a Territory-wide contest for schoolchildren. The thirteen-year-old seventh-grade designer was Benny Benson from the Aleutian Islands. (*At the time, Alaska was not yet a state; it had been a US Territory since the land was purchased from Russia in 1867.*)

On the design submission, Benny had written the following explanation:

"The blue field is for the Alaska sky and the forget-me-not, an Alaska flower. The North Star is for the future of the state of Alaska, the most northerly in the Union. The dipper is for the Great Bear — symbolizing strength."

Benny's flag was officially adopted by the legislature in 1927.

Alaska was officially recognized as a state on January 3, 1959.

5) How old was Benny when Alaska achieved statehood?

6) Think of someone you know who is old enough to remember 1959. (Your teacher is not old enough!). Find a time this week to visit or call and ask them if they remember anything about when Alaska became a state! Record what you learn below.

# **Defining Functions**

Functions can be viewed in *multiple representations*. You already know one of them: **Contracts**, which specify the Name, Domain, and Range of a function. Contracts are a way of thinking of functions as a *mapping* between one set of data and another. For example, a mapping from Numbers to Strings:

# f :: Number -> String

Another way to view functions is with *Examples*. Examples are essentially input-output tables, showing what the function would do for a specific input:

In our programming language, we focus on the last two columns and write them as code:

```
examples:
f(1) is 1 + 2
f(2) is 2 + 2
f(3) is 3 + 2
f(4) is 4 + 2
end
```

Finally, we write a formal **function definition** ourselves. The pattern in the Examples becomes *abstract* (or "general"), replacing the inputs with *variables*. In the example below, the same definition is written in both math and code:

f(x) = x + 2fun f(x): x + 2 end

Look for connections between these three representations!

- The function name is always the same, whether looking at the Contract, Examples, or Definition.
- The number of inputs in the Examples is always the same as the number of types in the Domain, which is always the same as the number of variables in the Definition.
- The "what the function does" pattern in the Examples is almost the same in the Definition, but with specific inputs replaced by variables.

# The Great gt domain debate!

Kermit: The domain of gt is Number, String, String.
Oscar: The domain of gt is Number .
Ernie: I'm not sure who's right!
In order to make a triangle, we need a size, a color and a fill style...
but all we had to tell our actor was gt(20) ...and they returned triangle(20, "solid", "green").
Please help us!

1) What is the correct domain for gt?

2) What could you tell Ernie to help him understand how you know?

# Let's Define Some New Functions!

1) Let's define a function rs to generate solid red squares of whatever size we give them!

If I say rs(5), what would our actor need to say?

Let's write a few more examples:	
$rs(\_) \rightarrow \_$	
rs()→	
$rs(\_) \rightarrow \_$	
What changes in these examples? Name your variable(s):	
fun rs():	end
2) Let's define a function bigc to generate big solid circles of size 100 in whatever color we give them! If I say bigc("orange"), what would our actor need to say?	
Let's write a few more examples:	
bigc()→	
bigc() →	
bigc()→	
What changes in these examples? Name your variable(s):	
fun bigc():	end
3) Let's define a function ps to build a pink star of size 50, with the input determining whether it's solid or outline! If I say ps("outline"), what would our actor need to say?	
Write examples for all other possible inputs:	
ps()→	
$ps(\_\_) \rightarrow \_$	
What changes in these examples? Name your variable(s):	
fun ps():	end

4) Add these new function definitions to your  $\underline{gt Starter File}$  and test them out!

# Let's Define Some More New Functions!

1) Let's define a function sun to write SUNSHINE in whatever color and size we give it!

If I say sun(5, "blue"), what would our actor need to say?

Let's write a few more examples:
sun(,)→
sun(,)→
sun(,)→
What changes in these examples? Name your variable(s):
fun sun(,):
end
2) Let's define a function me to generate your name in whatever size and color we give it!
fIsay me(18, "gold"), what would our actor need to say?
Let's write a few more examples:
ne(,)→
ne(,) →
ne(,)→
What changes in these examples? Name your variable(s):
fun me():
end
3) Let's define a function $gr$ to build a solid, green rectangle of whatever height and width we give it! If I say $gr(10, 80)$ , what would our actor need to say?
Let's write a few more examples:
$gr(\) \rightarrow rectangle("solid","green")$
$gr(\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $
$gr(\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ $
What changes in these examples? Name your variable(s):
fun gr(,):
end

4) Add these new function definitions to your <u>gt Starter File</u> and test them out!

## **Describe and Define Your Own Functions!**

1) Let's define a funct	ion	to generate	
lf I say	, what wou	d our actor need to say?	
Let's write a few more	examples:		
(	) →	()	
(	$) \rightarrow$	()	
(	) →	()	
What changes in these	e examples? Name y	our variable(s):	
Let's define our function	on using the variabl	2.	
fun(	):		end
2) Let's define a funct	ion	to generate	
lf I say	, what wou	d our actor need to say?	
Let's write a few more	examples:		
(	) →	()	
(	) →	()	
(	) →	()	
What changes in these	e examples? Name y	our variable(s):	
Let's define our function	on using the variabl	2.	
fun(	):		end
3) Let's define a funct	ion	to generate	
If I say Let's write a few more		d our actor need to say?	
(	)→	()	
(	)→	()	
(	)→	()	
What changes in these	e examples? Name y	our variable(s):	
Let's define our function	on using the variabl	2.	
fun (	):		end

4) Add your new function definitions to your <u>gt Starter File</u> and test them out!

Matching Examples and Cont	nples and Con	tracts
Match each set of examples (left) with the Contract that best describes it (right).		
Examples		Contract
examples: f(5) is 5 / 2 f(9) is 9 / 2 f(24) is 24 / 2 end	Ц	A #f::Number -> Number
<pre>examples:   f(1) is rectangle(1, 1, "outline", "red")   f(6) is rectangle(6, 6, "outline", "red") end</pre>	N	B #f::String -> Image
<pre>examples: f("pink", 5) is star(5, "solid", "pink") f("blue", 8) is star(8, "solid", "blue") end</pre>	ω	C #f::Number -> Image
<pre>examples:     f("Hi!") is text("Hi!", 50, "red")     f("Ciao!") is text("Ciao!", 50, "red") end</pre>	4	<pre>D # f :: Number, String -&gt; Image</pre>
<pre>examples:     f(5, "outline") is star(5, "outline", "yellow")     f(5, "solid") is star(5, "solid", "yellow") end</pre>	J	<pre>E # f :: String, Number -&gt; Image</pre>

## **Matching Examples and Function Definitions**

(1) Find the variables in gt and label them with the word "size".

```
examples:
  gt(20) is triangle(20, "solid", "green")
  gt(50) is triangle(50, "solid", "green")
```

end

fun gt(size): triangle(size, "solid", "green") end

(2) Highlight and label the variables in the example lists below.

(3) Then, using gt as a model, match the examples to their corresponding function definitions.

```
Examples
                                                                                                       Definition
examples:
 f("solid") is circle(8, "solid", "red")
                                                                        fun f(s): star(s, "outline", "red") end
                                                                 Α
                                                     1
 f("outline") is circle(8, "outline", "red")
end
examples:
 f(2) is 2 + 2
 f(4) is 4 + 4
                                                     2
                                                                 В
                                                                                      fun f(num): num + num end
 f(5) is 5 + 5
end
examples:
 f("red") is circle(7, "solid", "red")
                                                                 С
                                                                              fun f(c): star(9, "solid", c) end
                                                     3
 f("teal") is circle(7, "solid", "teal")
end
examples:
 f("red") is star(9, "solid", "red")
  f("grey") is star(9, "solid", "grey")
                                                                              fun f(s): circle(8, s, "red") end
                                                     4
                                                                 D
 f("pink") is star(9, "solid", "pink")
end
examples:
 f(3) is star(3, "outline", "red")
                                                     5
                                                                 Е
                                                                            fun f(c): circle(7, "solid", c) end
```

```
f(8) is star(8, "outline", "red")
end
```

## **Creating Contracts From Examples**

Write the contracts used to create each of the following collections of examples. The first one has been done for you.

```
1) # big-triangle :: Number, String -> Image
```

```
examples:
    big-triangle(100, "red") is triangle(100, "solid", "red")
    big-triangle(200, "orange") is triangle(200, "solid", "orange")
end
```

2)

```
examples:
   purple-square(15) is rectangle(15, 15, "outline", "purple")
   purple-square(6) is rectangle(6, 6, "outline", "purple")
end
```

### 3)

```
examples:
    sum(5, 8) is 5 + 8
    sum(9, 6) is 9 + 6
    sum(120, 11) is 120 + 11
end
```

4) \_\_\_\_\_

```
examples:
   banner("Game Today!") is text("Game Today!", 50, "red")
   banner("Go Team!") is text("Go Team!", 50, "red")
   banner("Exit") is text("Exit", 50, "red")
end
```

5)

```
examples:
  twinkle("outline", "red") is star(5, "outline", "red")
  twinkle("solid", "pink") is star(5, "solid", "pink")
  twinkle("outline", "grey") is star(5, "outline", "grey")
end
```

### 6) \_

examples: half(5) is 5 / 2 half(8) is 8 / 2 half(900) is 900 / 2 end

### 7)

```
examples:
   Spanish(5) is "cinco"
   Spanish(30) is "treinta"
   Spanish(12) is "doce"
end
```

## Contracts, Examples & Definitions - bc

We've already found the Contract for gt, generated Examples and described the pattern with a Function Definition. Let's review our process, beginning with the Word Problem.

Directions: Define a function called gt, which makes solid green triangles of whatever size we want.

Contract and Purpose Statement	
Every contract has three parts	
# gt:: Number	-> Image
function name Domain	Range
Examples	
Write some examples, then circle and label what changes examples:	
<u>function name</u> <u>input(s)</u> ) is <u>triangle(10, "solid"</u>	, "green") what the function produces
gt(20) is triangle(20, "solid"	. "areen")
function name input(s) end	what the function produces
Definition	
Write the definition, giving variable names to all your input values	
fun <u>gt(</u> <u>size</u> ):	
function name variable(s)	
triangle(size, "solid", "green") what the function does with t	those variable(c)
end	
Now, let's apply the same steps to think through a new problem! Directions: Define a function called bc, which makes solid blue circles of whate	ever radius we want.
Contract and Purpose Statement	
Every contract has three parts	
#:	->
function name Domai	n Range
Examples	
Write some examples, then circle and label what changes	
examples:	
( ) <b>is</b>	
function name input(s)	what the function produces
() is	what the function produces
end	what the function produces
2.6.11	
<b>Definition</b> Write the definition, giving variable names to all your input values	
fun():	

what the function does with those variable(s)

# Contracts, Examples & Definitions - Stars

Directions: Define a function called sticker, which consumes a color and draws a solid 50px star of the given color.

Contract and Purpose Statement	
Every contract has three parts	
# :	->Range
Examples	
Write some examples, then circle and label what changes examples:	
() is	what the function produces
function name input(s) is input(s)	what the function produces
<b>Definition</b> Write the definition, giving variable names to all your input values	
write the demittion, giving variable names to an your input values	
fun ():	
what the function does with those variable(s	)
end	

### Directions: Define a function called gold-star, which takes in a radius and draws a solid gold star of that given size.

Con	tract and Purpose State	ment					
Every	contract has three parts.						
#	function name			Domain		>	Range
Exai	mples						
Write examp	some examples, then circ <b>ples:</b>	cle and label what chan	ges				
	function name	input(s)	) is		what the function produces		
	function name	input(s)	) is		what the function produces		
end							
Defi	inition						
Write	the definition, giving var	iable names to all your	input values				
fun _	function name	(var	iable(s)	):			
			vhat the function	does with those variable(	s)		

# Contracts, Examples & Definitions - Name

Directions: Define a function called name-color, which makes an image of your name at size 50 in whatever color is given.

Contract and Purpose Statement			
Every contract has three parts			
# ::			->
function name	Domain		Range
Examples			
Write some examples, then circle and label what changes			
examples:			
,	) ic		
function name input(s)	) is	what the function produces	
(	) is		
function name input(s)		what the function produces	
end			
Definition			
Write the definition, giving variable names to all your input	values		
fun (	١.		
function name variable(s)	):		
	ne function does with those variable	(s)	
end			
Directions: Define a function called name-size, which ma	kes an image of your name in y	our favorite color (be sure to spe	cify your name and
favorite color!) in whatever size is given.			
Contract and Purpose Statement			
Every contract has three parts			
# :			->
function name	Domain		Range
Evennler			
<b>Examples</b> Write some examples, then circle and label what changes			
examples:			
,	· •		
function name input(s)	) is	what the function produces	
1	) is		
function name input(s)		what the function produces	
end			
Definition			
Write the definition, giving variable names to all your input	values		
fun(	):		
function name variable(s)			
	ne function does with those variable		

## Do the Examples Have the Same Contracts?

For each pair of Examples below, decide whether the two examples have the same Contract. If they do, fill in the Contract in the space provided. If not, write a few words explaining how you know their contracts aren't the same.

```
1)
examples:
   mystery(30) is 30 * 50
   mystery(10) is text("Welcome!", 10, "darkgreen")
end
```

2)

examples:							
mystery(30,	40)	ίs	40	-	(2	*	30)
mystery(10,	15)	is	15	_	(2	*	10)
end							

3) \_\_\_\_\_

```
examples:
  mystery("New York") is text("New York", 20, "red")
  mystery(20) is text("New York", 20, "red")
end
```

4) \_\_\_\_

```
examples:
    mystery("green", 32) is circle(32, "outline", "green")
    mystery(18, "green") is circle(18, "outline", "green")
end
```

5) \_\_\_\_\_

```
examples:
    mystery(6, 9, 10) is 6 / (9 + 10)
    mystery(3, 7) is 3 / (7 + 10)
end
```

6) \_

```
examples:
  mystery("red", "blue") is text("blue", 25, "red")
  mystery("purple", "Go Team!") is text("Go Team!", 25, "purple")
end
```

## Do the Examples Have the Same Contracts? (2)

For each pair of Examples below, decide whether the two examples have the same Contract. If they do, fill in the Contract in the space provided. If not, write a few words explaining how you know their contracts aren't the same.

### 1) \_\_\_\_\_

```
examples:
  mystery(triangle(70, "solid", "green")) is triangle(140, "solid", "green")
  mystery(circle(100, "solid", "blue")) is circle(200, "solid", "blue")
end
```

2) \_

```
examples:
  mystery("red") is triangle(140, "solid", "red")
  mystery("blue", "circle") is circle(140, "solid", "blue")
end
```

#### 3)

```
examples:
   mystery("+", 4, 5) is 4 + 5
   mystery("sqrt", 25) is num-sqrt(25)
end
```

### 4) \_\_\_\_\_

```
examples:
  mystery("circle", 4) is num-pi * num-sqr(4)
  mystery("square", 5) is num-sqr(5)
end
```

### 5) \_

```
examples:
  mystery("dog") is 3
  mystery("cat") is "kitten"
end
```

6)

```
examples:
  mystery("dog") is 3
  mystery("kitten") is 6
end
```

# Matching Examples and Contracts (2)

## **Solving Word Problems**

Being able to see functions as Contracts, Examples or Definitions is like having three powerful tools. These representations can be used together to solve word problems! We call this **The Design Recipe**.

1) When reading a word problem, the first step is to figure out the **Contract** for the function you want to build. Remember, a Contract must include the Name, Domain and Range for the function!

2) Then we write a **Purpose Statement**, which is a short note that tells us what the function *should do*. Professional programmers work hard to write good purpose statements, so that other people can understand the code they wrote! Programmers work on teams; the programs they write must outlast the moment that they are written.

3) Next, we write at least two **Examples**. These are lines of code that show what the function should do for a *specific* input. Once we see examples of at least two inputs, we can *find a pattern* and see which parts are changing and which parts aren't.

4) To finish the Examples, we circle the parts that are changing, and label them with a short variable name that explains what they do.

5) Finally, we **define the function** itself! This is pretty easy after you have some examples to work from: we copy everything that didn't change, and replace the changeable stuff with the variable name!

# **Matching Word Problems and Purpose Statements**

Match each word problem below to its corresponding purpose statement.

Annie got a new dog, Xavier, that eats about 5 times as much as her little dog, Rex, who is 10 years old. She hasn't gotten used to buying enough dogfood for the household yet. Write a function that generates an estimate for how many pounds of food Xavier will eat, given the amount of food that Rex usually consumes in the same amount of time.

A Consume the pounds of food Rex eats and add 5.

Adrienne's raccoon, Rex, eats 5 more pounds of food each week than her pet squirrel, Lili, who is 7 years older. Write a function to determine how much Lili eats in a week, given how much Rex eats.

2

Alejandro's rabbit, Rex, poops about 1/5 of what it eats. His rabbit hutch is 10 cubic feet. Write a function to figure out how much rabbit poop Alejandro will have to clean up depending on how much Rex has eaten.

ო

Max's turtle, Rex, eats 5 pounds less per week than his turtle, Harry, who is 2 inches taller. Write a function to calculate how much food Harry eats, given the weight of Rex's food.

4

**B** Consume the pounds of food Rex eats and subtract 5.

C Consume the pounds of food Rex eats and multiply by 5.

D Consume the pounds of food Rex eats and divide by 5.

# Writing Examples from Purpose Statements

We've provided contracts and purpose statements to describe two different functions. Write examples for each of those functions.

Contract and Purpose Statement			
Every contract has three parts			
# triple::	Number Domain	->>>	Number Range
# Consumes a Number and triples it.	what does the function do?		
Examples	what does the function do.		
Write some examples, then circle and label what chan examples:	ges		
(	) is	what the function produces	
function name input(s)	) is	what the function produces	
Contract and Purpose Statement			
Every contract has three parts			
<pre># upside-down::</pre>	Image Domain	>>	Image Range
# Consumes an image, and turns it up	side down by rotating i what does the function do?	t 180 degrees.	
Examples			
Write some examples, then circle and label what chan examples:	ges		
function_nameinput	) is	what the function produces	
		what the function produces	
function name input(s) end	) is	what the function produces	

## **Fixing Purpose Statements**

Beneath each of the word problems below is a purpose statement (generated by ChatGPT!) that is either missing information or includes unnecessary information.

- Write an improved version of each purpose statement beneath the original.
- Then, explain what was wrong with the ChatGPT-generated Purpose Statement.

1) Word Problem: The New York City ferry costs \$2.75 per ride. The Earth School requires two chaperones for any field trip. Write a function fare that takes in the number of students in the class and returns the total fare for the students and chaperones.

ChatGPT's Purpose Statement: Take in the number of students and add 2.

Improved Purpose Statement:

Problem with ChatGPT's Purpose Statement:

2) Word Problem: It is tradition for the Green Machines to go to Humpy Dumpty's for ice cream with their families after their soccer games. Write a function cones to take in the number of kids and calculate the total bill for the team, assuming that each kid brings two family members and cones cost \$1.25.

ChatGPT's Purpose Statement: Take in the number of kids on the team and multiply it by 1.25.

Improved Purpose Statement:

Problem with ChatGPT's Purpose Statement:

3) Word Problem: The cost of renting an ebike is \$3 plus an additional \$0.12 per minute. Write a function ebike that will calculate the cost of a ride, given the number of minutes ridden.

ChatGPT's Purpose Statement: Take in the number of minutes and multiply it by 3.12.

Improved Purpose Statement:

Problem with ChatGPT's Purpose Statement:

4) Word Problem: Suleika is a skilled house painter at only age 21. She has painted hundreds of rooms and can paint about 175 square feet an hour. Write a function paint that takes in the number of square feet of the job and calculates how many hours it will take her.

ChatGPT's Purpose Statement: Take in the number of square feet of walls in a house and divide them by 175 then add 21 years.

Improved Purpose Statement:

Problem with ChatGPT's Purpose Statement:

# Word Problem: rocket-height

**Directions:** A rocket blasts off, and is now traveling at a constant velocity of 7 meters per second. Use the Design Recipe to write a function rocket-height, which takes in a number of seconds and calculates the height.

Contract and Purpos	se Statement						
Every contract has thre	ee parts						
#function_name	::::			Domain		>	Range
#							Ū
<u>n</u>			what does the	e function do?

		wł	hat the function do	es with those varia	able(s)		
end							

# Writing Examples from Purpose Statements (2)

We've provided contracts and purpose statements to describe two different functions. Write examples for each of those functions.

Contract and Purpose Statement				
Every contract has three parts				
<pre># half-image:: function name</pre>	Image Domain		>	Image Range
# Consumes an image, and p	voluces that image scaled to half	its size.		
Examples				
Write some examples, then circle and examples:	label what changes			
((	) is			
	what the function produces			
function name	) is			
end	what the function produces			
Contract and Purpose Statement				
Every contract has three parts				
# product-squared::	Number, Number Domain		>	Number Range
# Consumes two numbers and	squares their product what does the function do?			
Examples				
Write some examples, then circle and	label what changes			
examples:				
((	) is	what the function produces		
(	) is			
function name	input(s)	what the function produces		

# **Rocket Height Challenges**

1) Can you make the rocket fly faster?

2) Can you make the rocket fly slower?

3) Can you make the rocket sink down instead of fly up?

4) Can you make the rocket accelerate over time, so that it moves faster the longer it flies?

5) Can you make the rocket blast off and then land again?

6) Can you make the rocket blast off, reach a maximum height of exactly 1000 meters, and then land?

7) Can you make the rocket blast off, reach a maximum height of exactly 1000 meters, and then land after exactly 100 seconds?

8) Can you make the rocket fly to the edge of the the universe?

# **Design Recipe Telephone**

Most computer programs are written by huge teams! It is critical that each team member records their thinking with enough detail for other team members to be able to pick up where they left off. We're going to practice collaborative programming through an activity called Design Recipe Telephone.

### 1. Prepare the class and the materials

Choose which set of word problems you are going to start with and print enough copies so that each student will get one word problem. Divide the class into groups of three.

Give each student within each group a different word problem from the set.

Word Problem Set 1:	Word Problem Set 2:	Option 3:
Design Recipe Telephone Set 1: g Design Recipe Telephone Set 1: h Design Recipe Telephone Set 1: r ★ Once completed, the set of functions generated from these word problems can be used to fix the code in this <u>Collaboration</u> <u>Starter File - For use with Design Recipe</u> <u>Telephone Set 1</u> . If all the functions are defined correctly, the starter file will then generate a cool image!	<u>Design Recipe Telephone Set 2: symmetry</u> <u>Design Recipe Telephone Set 2: I-rect</u> <u>Design Recipe Telephone Set 2: right-trapezoid</u>	Use any of the Design Recipe problems that students haven't solved before. ★ There is a large collection of math problems that would work well with the Design Recipe in the Additional Exercises section of our Solving Word Problems with the Design Recipe lesson.

## 2. Describe the rules for the activity

- In this activity, each person in your group will start with a different word problem. You will each be doing *one step of each Design Recipe problem*. After you complete your step, you will fold your paper to hide the part that you were looking at so that only *your work and the rest of the recipe* are visible. Then you will pass your work to the person to your right.
- The person who has received your paper will review your work and complete the next step based solely on what you wrote down for them. If they don't have the information they need, they will give the paper back to you for revision.
- Meanwhile, you will receive a different problem from the person to your left. If at any point your realize that the person before you didn't provide enough information, you may hand the paper back to them for revision.

Round 1 - Writing Contract and Purpose Statements from the Word Problem							
Student 1 - Problem A     Student 2 - Problem B     Student 3 - Problem C							
everyone folds over the previous section, and passes their paper to the right							
Student 1 - Problem C	d solely on the Contract and Purpose Statem Student 2 - Problem A	ent Student 3 - Problem B					
		Student 3 - Froblem B					
everyone folds over the previous section, and passes their paper to the right							
		s their paper to the right					
	ryone folds over the previous section, and passe itions <b>based solely on the Examples</b>	s their paper to the right					

### 3. Practice makes perfect!

This activity can be repeated several times, or done as a timed competition between teams. The goal is to emphasize that each step - if done correctly - makes the following step incredibly simple.

## 4. Synthesize

The Design Recipe is a way of slowing down and thinking through each step of a problem.

- If we already know how to get the answer, why would it ever be important to know how to do each step the slow way?
- Sample Responses: Someday we won't be able to get the answer, and knowing the steps will help. We can help someone else who is stuck. We can work with someone else and share our thinking. We can check our work.

# The Design Recipe (Restaurants)

**Directions:** Use the Design Recipe to write a function split-tab that takes in a cost and the number of people sharing the bill and splits the cost equally.

Contract and Purpose Statement	
Every contract has three parts	
#: function name Domain	->Range
# what does the function do?	
Examples	
Write some examples, then circle and label what changes examples:	
() is	25
function name input(s) is what the function produce	25
end	
Definition	
Write the definition, giving variable names to all your input values	
fun():	
end	

**Directions:** Use the Design Recipe to write a function tip-calculator that takes in the cost of a meal and returns the 15% tip for that meal.

Contract and Purpose S	tatement			
Every contract has three p	arts			
#function_name	:	Dor	nain	>Range
#		what does the func	tion do?	
Examples		what does the func		
Write some examples, the examples:	n circle and label what cha	nges		
function name	(	) is	what the function produces	
function name end	input(s)	, , , ,	what the function produces	
Definition				
Write the definition, giving	g variable names to all you	r input values		
fun function name	(	ariable(s)	<u>)</u> :	
		what the function does wit	h those variable(s)	

# The Design Recipe (Direct Variation)

**Directions:** Use the Design Recipe to write a function wage, that takes in a number of hours worked and returns the amount a worker will get paid if their rate is \$10.25/hr.

Contract and Purpose Statement		
Every contract has three parts		
#	->	
function name Domain		Range
# what does the function do?		
Examples		
Write some examples, then circle and label what changes <b>examples:</b>		
function name input(s) is		
function name input(s) is		
Definition		
Write the definition, giving variable names to all your input values		
fun(): function name variable(s)		
what the function does with those variable(s) end		

**Directions:** On average, people burn about 11 calories/minute riding a bike. Use the Design Recipe to write a function calories-burned that takes in the number of minutes you bike and returns the number of calories burned.

Contract and Pu	pose statement						
Every contract has	three parts						
# function nam	e:			Number Domain		>_	Number Range
#							
			what does the	function do?			
Examples							
Write some examp examples:	les, then circle an	d label what chan	ges

fun): function name variable(s)	
what the function does with those variable(s) end	

<sup>#</sup> right-triangle :: Number, Number, String, String -> Image # Takes in 2 side lengths, a color, and a fill type and makes a right-triangle

## **Rubric: Design Recipe**

This rubric can be used for teachers to score students' Design Recipes or for peer review. If using this rubric for peer review, trade your Design Recipe with another student. Place this rubric and their Design Recipe side-by-side in front of you.

1) Go through the checklist in the left-hand column to assess their Contract. Check boxes or leave them blank depending on what you observe.

2) Once you have examined and analyzed the Contract, read the descriptive text (either "Wow!" or "Getting there") and check whichever one more accurately describes the work in front of you.

3) If the Design Recipe you're reviewing is "getting there," provide some descriptive feedback to help the student fix their work.

4) Repeat the process for the remaining sections of the Design Recipe.

The CONTRACT:	□ Wow!	Getting There
<ul> <li>has correct function name</li> <li>has correct amount of Domain data types</li> <li>has correct data type(s) listed in the Domain</li> <li>has correct data type listed for the Range</li> </ul>	The Contract you've written tells us a lot about how to use the function. In fact, we can figure out how to use your function just by looking at the Contract. You've included all essential information.	Something is missing from your Contract. It doesn't provide everything needed to understand the function. <i>Here's what you need to do:</i>
The PURPOSE STATEMENT:	UWow!	Getting There
<ul> <li>describes what the function consumes and produces</li> <li>describes how the result is computed, so that it can be combined to with the Contract to explain the Examples</li> </ul>	The Purpose Statement is a concise and detailed restatement of the problem in your own words. It's a helpful explanation of what's happening in the problem.	Programmers and Mathematicians alike find it helpful to restate a problem in their own words. Your restatement is missing the following:
The <b>EXAMPLES</b> :	UWow!	Getting There
<ul> <li>have the correct function name</li> <li>have inputs that differ across Examples</li> <li>have the correct amount of Domain inputs</li> <li>have the correct expressions for what the function produces, using the given inputs</li> <li>have changeable parts circled and labeled</li> </ul>	Your Examples not only help us to identify the pattern to define a function, they also let us double check that the functions we define do what we intend for them to do.	Your Examples do not help us to identify a pattern, or they don't allow us to double check our functions. <i>Here's how you can improve that</i> :
The <b>DEFINITION</b> :	UWow!	Getting There
<ul> <li>□ has the correct function name</li> <li>□ has the correct number, name, and order of variables (taken from the labels in the Examples section)</li> </ul>	Your code correctly names the function, lists its variables, and states the expression to compute when the function is used!	Your Definition is missing something. <i>Here's how to fix it:</i>

Intro to Data Structures

## Word Problem: double-radius

**Directions:** Write a function double-radius, which takes in a radius and a color. It produces an outlined circle of whatever color was passed in, whose radius is twice as big as the input.

Contract and Purpose Stat	ement					
Every contract has three parts						
#: function_name	:		Domain		>	Range
#						
Examples		what does the	e function do?			
Write some examples, then c examples:	ircle and label what ch	anges				
	(	) is				
function name	input(s)			what the function produces		
	(	) is				
function name end	input(s)			what the function produces		
Definition						
Write the definition, giving va	ariable names to all you	ır input values				
fun	(		):			
function name	<u> </u>	/ariable(s)	·			
and		what the function do	es with those varial	ple(s)		
end						

## Word Problem: double-width

**Directions:** Write a function double-width, which takes in a number (the length of a rectangle) and produces a rectangle whose length is twice the given length.

Contract and Purp	ose Statement						
Every contract has th	nree parts						
#function name	:			Domain		>	Range
#							Ũ
<u>n</u>			what does th	e function do?			
Examples							
Write some example examples:	s, then circle and	label what chang	ges				
	(		) is				
function nan	ne``	input(s)			what the function produces

fun	(			):			
function	name	vari	iable(s)				
		v	vhat the function do	pes with those var	iable(s)		
end							

## Word Problem: next-position

Directions: Write a function next-position, which takes in two numbers (an x- and y-coordinate) and returns a DeliveryState, increasing

the x-coordinate by 5 and decreasing the y-coordinate by 5. **Contract and Purpose Statement** Every contract has three parts... # Domain function name Range # what does the function do? Examples Write some examples, then circle and label what changes... examples: ) is input(s) what the function produces function name ) is \_\_\_ input(s) what the function produces function name end Definition Write the definition, giving variable names to all your input values... ): fun variable(s) function name what the function does with those variable(s)

end

## Data Structure: CakeType

data Cake	eType is a flavor, layers, & is-iceCream «eType:	
cake(	2(	
end	)	
1) To make an	an instance of this structure, I would write:	
	an instance of this structure, I would write:	
cake1 = _		
cake1 = _		

### Word Problem: taller-than

Directions: Write a function called taller-than, which consumes two CakeTypes, and produces true if the number of layers in the first

CakeT	ype is greater than the nu	Imber of layers in the s	econd.			
Con	tract and Purpose Staten	nent				
Every	contract has three parts					
#	:				>

### What things are changing?

Thing	Describe how it changes

### What fields do you need to represent the things that change?

Field name (dangerX, score, playerIMG)	data type (Number, String, Image, Boolean)

Make a To-Do List, and check off each as "Done" when you finish each one.				
Component	When is there work to be done?	To-Do	Done	
Data Structure	If any new field(s) were added, changed, or removed			
draw-state	If something is displayed in a new way or position	$\checkmark$		
next-state-tick	If the Data Structure changed, or the animation happens automatically			
next-state-key	If the Data Structure changed, or a keypress triggers the animation			
reactor	If either next-state function is new			

### Define the Data Structure

# a	_State is	
data	State:	
	(	 _
		 -
		-
		_)
end		

#### 1) Make a sample instance for each sketch from the previous page

 _ =	
 _ =	
_ =	

### 2) Write an example for one of the functions on the previous page

# Line Length Explore

Sign in to code.pyret.org (CPO) and open your Game File.

### **Defining** line-length

Find the definition for the line-length function and consider the code you see.

1) What do you Notice?

2) What do you Wonder?

### Using line-length

Click Run, and practice using line-length in the Interactions Area with different values for a and b.

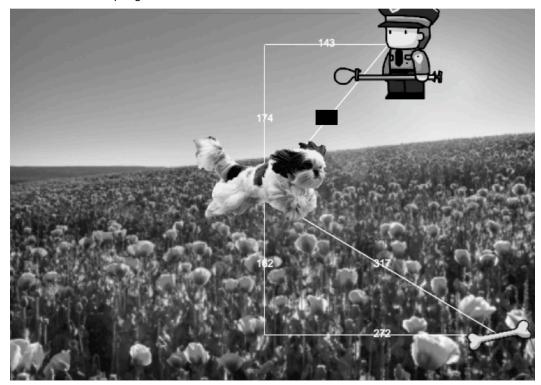

3) What does the line-length function do?

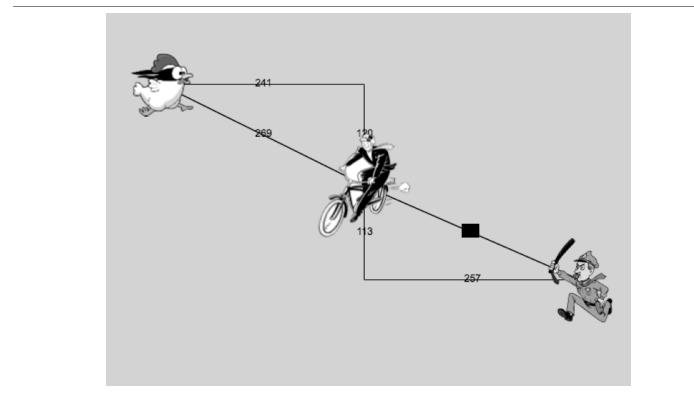

4) Why does it use conditionals?

5) Why is the distance between two points always positive?

# Writing Code to Calculate Missing Lengths

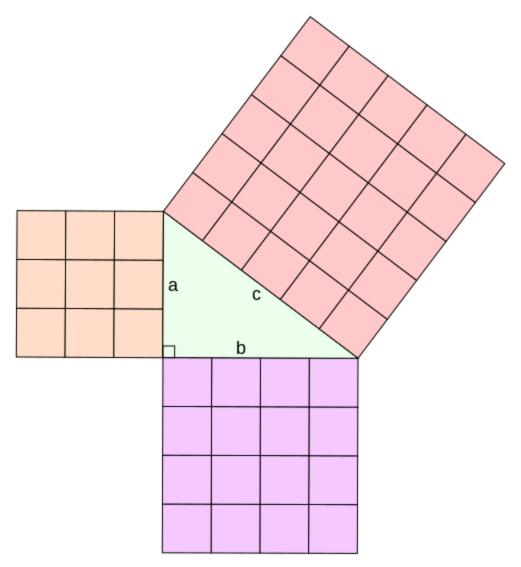

In each of the game screenshots below, one of the distance labels has been hidden. Write the code to generate the missing distance on the line below each image. *Hint: Remember the Pythagorean Theorem*!

### **Proof Without Words**

Long ago, mathematicians realized that there is a special relationship between the three squares that can be formed using the sides of a right triangle.

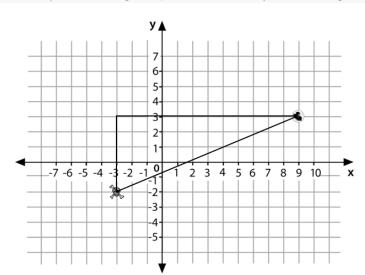

How would you describe the relationship you've observed between the three squares whose side-lengths are determined by the lengths of the sides of a right triangle?

## Distance on the Coordinate Plane

### Reading Code:

### Distance between the Pyret and the boot:

num-sqrt(num-sqr(line-length(9, -3)) + num-sqr(line-length(3, -2)))

 1) Where do the 9 and -3 come from?

 2) Where to the 3 and -2 come from?

 3) Explain how the code works.

### Writing Code

Now write the code to find the distance between this boot and pyret.

## Circles of Evaluation: Distance between (0, 2) and (4, 5)

Suppose your player is at (0, 2) and a character is at (4, 5)...

1) Identify the values of  $x_1$ ,  $y_1$ ,  $x_2$ , and  $y_2$ 

$x_1$	$y_1$	$x_2$	$y_2$
(x-value of 1st point)	(y-value of 1st point)	(x-value of 2nd point)	(y-value of 2nd point)

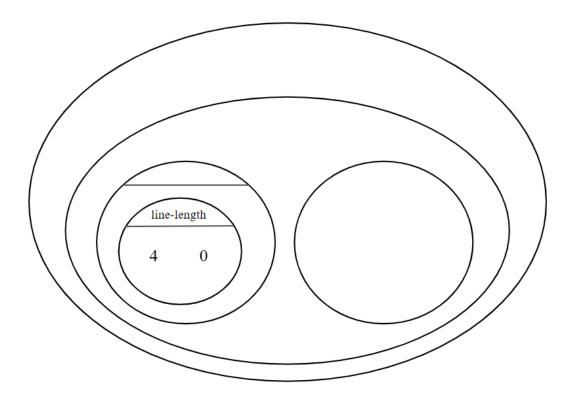

What is the distance between your player and the character?

- We can use line-length to computer the horizontal and vertical distances and then use those to find the diagonal distance.
  - The horizontal distance between  $x_1$  and  $x_2$  is computed by line-length(x2, x1).
  - The vertical distance between  $y_2$  and  $y_1$  is computed by line-length(y2, y1).
- The hypotenuse of a right triangle with legs the lengths of those distances is computed by:  $\sqrt{\text{line-length}(x_2, x_1)^2 + \text{line-length}(y_2, y_1)^2}$
- So, when we substitute these points in, the distance between them will be computed by:

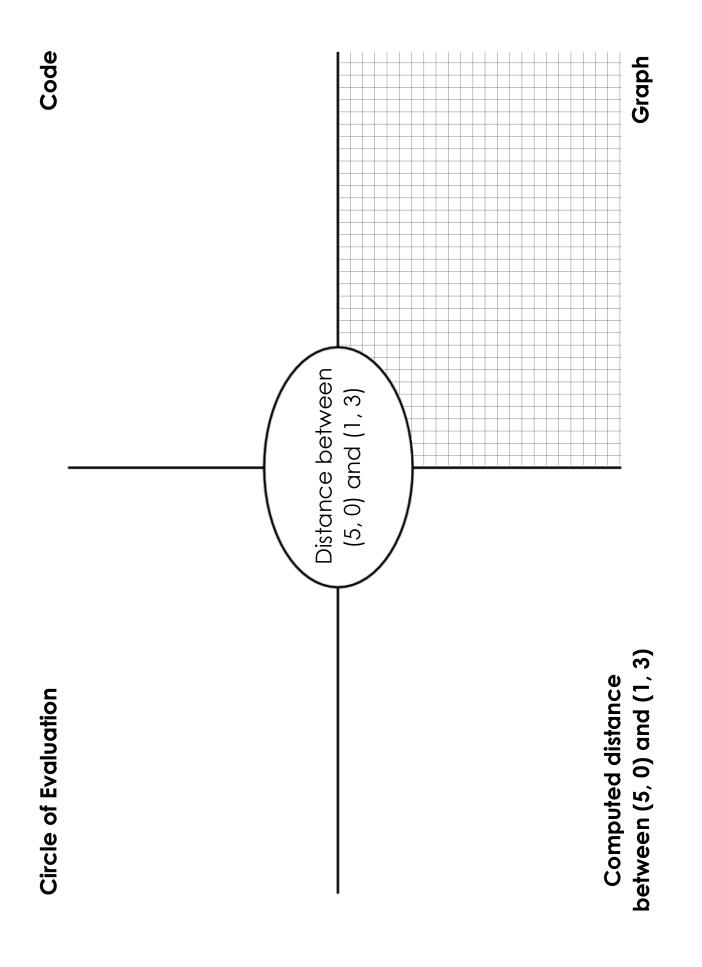

$$\sqrt{ ext{line-length}(4,0)^2 + ext{line-length}(5,2)^2}$$

2) The points are (0,2) and (4,5). Why aren't we using line-length(0, 2) and line-length(4, 5)?

3) Translate the expression above, for (0,2) and (4,5) into a Circle of Evaluation below. Hint: In our programming language num-sqr is used for  $x^2$  and num-sqrt is used for  $\sqrt{x}$ 

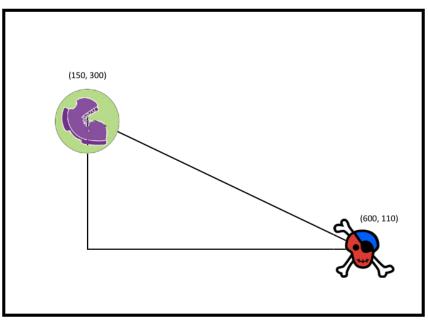

4) Convert the Circle of Evaluation to Code below.

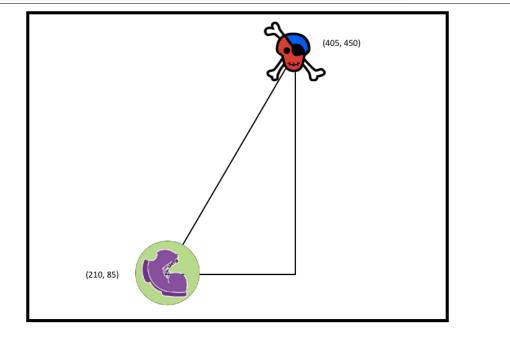

## **Distance From Game Coordinates**

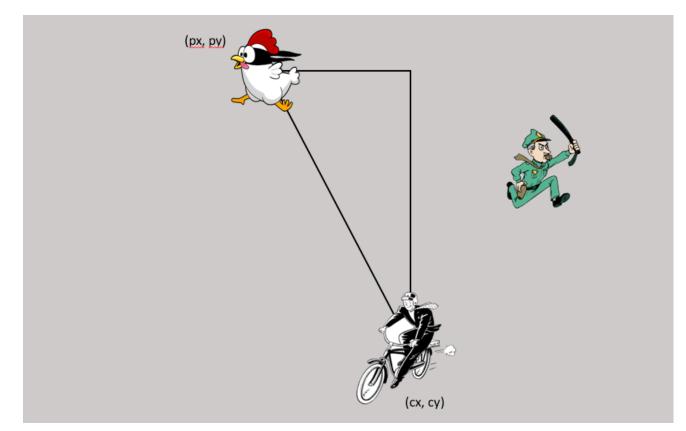

For each of the game screenshots, write the code to calculate the distance between the indicated characters. The first one has been done for you.

num-sqrt(num-sqr(line-length(600, 150)) + num-sqr(line-length(110, 300)))

# Distance (px, py) to (cx, cy)

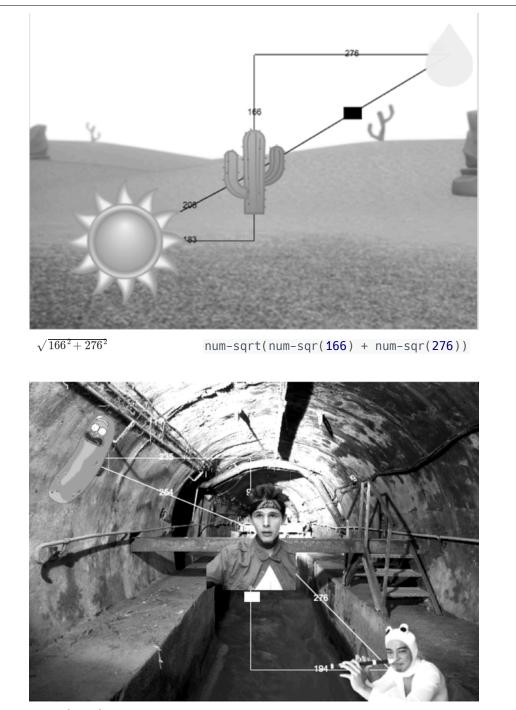

**Directions:** Use the Design Recipe to write a function distance, which takes in FOUR inputs: px and py (the x- and y-coordinate of the Player) and cx and cy (the x- and y-coordinates of another character), and produces the distance between them in pixels.

#### **Contract and Purpose Statement**

Every contract has three par	ts					
#function_name			Domain		>	Range
#		what does th	e function do?			
Examples		what does th				
Write some examples, then o	ircle and label what char	ges				
examples:						
function name	_(input(s)	) is		what the function produces		
function name end		) is		what the function produces		
Definition						
Write the definition, giving v	ariable names to all your	input values				
funfunction name	(	iable(s)	):			
end		what the function do	bes with those varia	ble(s)		

## **Comparing Code: Finding Missing Distances**

For each of the game screenshots below, the math and the code for computing the covered distance is shown. Notice what is similar and what is different about how the top and bottom distances are calculated. Think about why those similarities and differences exist and record your thinking.

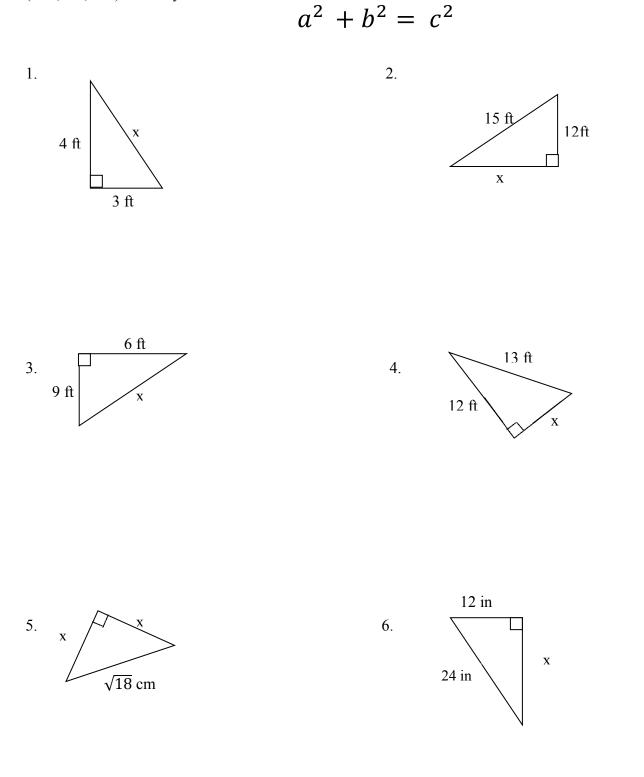

num-sqrt(num-sqr(276) - num-sqr(194))

 $\sqrt{276^2 - 194^2}$ 

### Name:\_

### Date: \_\_\_\_\_ Pythagorean Theorem Practice

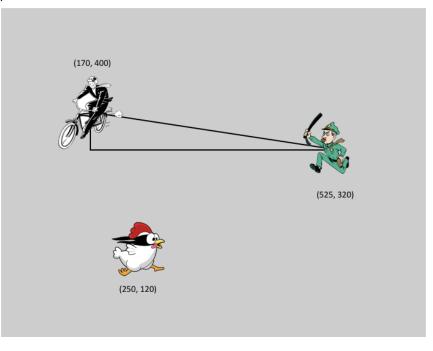

Label the hypotenuse of the triangle c. In each triangle find the length of the side marked *x* to the nearest unit (foot, cm, etc.). Show your work.

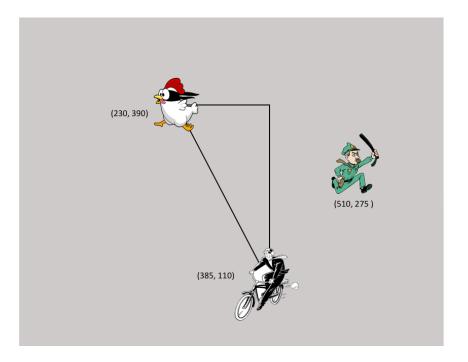

## **Distance From Game Coordinates 2**

For each of the game screenshots below, write the code to calculate the distance between the indicated characters. *Refer to Distance from Game Coordinates for an Example.* 

# Word Problem: line-length

**Directions:** Write a function called line-length, which takes in two numbers and returns the **positive difference** between them. It should always subtract the smaller number from the bigger one. If they are equal, it should return zero.

Contract and Purpose Statement	
very contract has three parts	
:	->
function name Domain	Range
what does the function do?	
Examples	
/rite some examples, then circle and label what changes <b>camples:</b>	
line-length(     10, 5     ) is 10 - 5       function name     input(s)     what the function produces	
line-length(       2, 8       ) is 8 - 2         function name       input(s)       what the function produces	
nd	
Definition	
/rite the definition, giving variable names to all your input values	
In(): function name variable(s)

else:	
end	
nd	

Collisions			

## Distance

The Player is at (4, 2) and the Target is at (0, 5).

Distance takes in the player's x, player's y, character's x and character's y. Use the formula below to fill in the EXAMPLE:  $\sqrt{(4-0)^2+(2-5)^2}$ 

Convert it into a Circle of Evaluation. (We've already gotten you started!)

Convert it to Pyret code.

### Word Problem: distance

**Directions:** Write a function distance, which takes FOUR inputs: (1) px: The x-coordinate of the player, (2) py: The y-coordinate of the player, (3) cx: The x-coordinate of another game character, (4) cy: The y-coordinate of another game character. It should return the distance between the two, using the Distance formula: Distance<sup>2</sup> =  $(px - cx)^2 + (py - cy)^2$ 

Contract and Purpose Statement	
Every contract has three parts	
#	->
function name Domain	Range
¥	
what does the function do? Examples	
Write some examples, then circle and label what changes examples:	
() is function name input(s) what the function produces	
function name input(s) is what the function produces	
end	
Definition	
Write the definition, giving variable names to all your input values	
fun(): function name variable(s)	
what the function does with those variable(s)	

### Word Problem: is-collision

**Directions:** Write a function is-collision, which takes FOUR inputs: (1) px: The x-coordinate of the player, (2) py: The y-coordinate of the player, (3) cx: The x-coordinate of another game character, (4) cy: The y-coordinate of another game character. It should return true if the coordinates of the player are within **50 pixels** of the coordinates of the other character. Otherwise, false.

Contract and Purpose Statement	
Every contract has three parts	
¥	->
function name Domain	Range
¥	
what does the function do? Examples	
Write some examples, then circle and label what changes examples:	
() is	
function name input(s) is	
end	
Definition	
Write the definition, giving variable names to all your input values

### **Contracts for Reactive**

Contracts tell us how to use a function, by telling us three important things:

- 1. The Name
- 2. The Domain of the function what kinds of inputs do we need to give the function, and how many?
- 3. The Range of the function what kind of output will the function give us back?

For example: The contract triangle :: (Number, String, String) -> Image tells us that the name of the function is triangle, it needs three inputs (a Number and two Strings), and it produces an Image.

With these three pieces of information, we know that typing triangle(20, "solid", "green") will evaluate to an Image.

Name	Domain		Range
# above ::	( <u>Image</u> , <u>Image</u> ) above below	->	Image
<pre>above(circle(10, "solid", "</pre>	'black"), square(50, "solid", "red"))		
<pre># beside ::</pre>	( <u>Image</u> , <u>Image</u> ) left right	->	Image
<pre>beside(circle(10, "solid",</pre>	"black"), square(50, "solid", "red"))		
# circle ::	( <u>Number</u> , <u>String</u> , <u>String</u> ) radius fill-style color	->	Image
