

Materials for Teachers using Connected Mathematics (Grade 7)

Like CMP3, Bootstrap is field-tested and research-validated, with a focus on deep exploration that supports and engages all kinds of learners. Our integrated computing modules have been proven to support math transfer and can be mixed and matched to supplement what you're already doing in your classroom. *Teaching 7th grade math with Bootstrap also addresses many CS Standards, including: 2-AP-1, 2-AP-10, 2-AP-11, 2-AP-13, 2-AP-14, 2-AP-17 2-AP-19, 2-AP-21, 2-DA-08.*

CMP3 Unit	Integrated Computing Lessons that can extend the CMP3 Unit																																			
Shapes and Designs: <i>Two-Dimensional Geometry</i>	<p>Function Composition</p> <ul style="list-style-type: none"> Get your students coding with highly motivational image functions! Writing simple code to build a wide range of shapes of different colors and sizes, reinforces vocabulary for describing polygons. Students think about multiple strategies for describing right-isosceles triangles. 																																			
Accentuate the Negative: <i>Integers and Rational Numbers</i>	<p>Order of Operations</p> <ul style="list-style-type: none"> Instead of a list of rules to memorize, we use the Circles of Evaluation to expose the structure of the math involved in evaluating expressions. Check it out! It's a powerful tool. <i>These materials can be used without any programming.</i> 																																			
Stretching and Shrinking: <i>Understanding Similarity</i>	<p>Function Composition</p> <ul style="list-style-type: none"> The Wumps are a powerful tool for understanding similarity and distortion. And, for some students, plotting coordinates by hand is arduous! Looking for follow up materials that will engage students in thinking about scale factors with more immediate feedback? We've got you! Simple code allows students to experiment with scaling images up and down and distorting them. The programming environment can work with images as a wide-ranging as a shape, a student's name, or any image from a student's google drive. 	<p><i>scale-xy(2, 5, dog)</i></p>  <p><i>scale(0.1, dog)</i> </p>																																		
Comparing and Scaling: <i>Ratios, Rates, Percent, Proportions</i>	<p>Transforming and Composing Images</p> <ul style="list-style-type: none"> Flags are an authentic application for ratios and scaling! Flags also offer our students a rare opportunity to connect to and share pride in their identities in math class. In this lesson, students write code both to scale and locate shapes on the coordinate grid to recreate an image of their choosing. This activity is low-threshold and high-ceiling. Students of all kinds of minds love building flags - some will make many! And they take great pride in seeing their flags and code hanging on classroom walls. 																																			
Moving Straight Ahead: <i>Linear Relationships</i>	<p>Functions Can Be Linear</p> <ul style="list-style-type: none"> We offer an abundance of interactive materials to get students thinking about whether relationships represented in tables and graphs are linear. <i>No programming required</i> <p>Defining Linear Functions</p> <ul style="list-style-type: none"> These interactive materials invite students to investigate linear relationships in tables, graphs, & function definitions. 	<p>Matching the table, graph and definitions of linear functions</p> <table border="1" data-bbox="1192 1520 1503 1860"> <tr> <td>$f(x) = \frac{2}{3}x + 1$</td> <td>x</td> <td>y</td> <td></td> </tr> <tr> <td></td> <td>2</td> <td>0</td> <td>$f(x) = -3x - 1$</td> </tr> <tr> <td></td> <td>4</td> <td>-1</td> <td>$f(x) = -\frac{1}{2}x + 1$</td> </tr> <tr> <td></td> <td>6</td> <td>-2</td> <td>$f(x) = 2x - 1$</td> </tr> <tr> <td><table border="1" data-bbox="1192 1671 1292 1860"> <thead> <tr><th>x</th><th>y</th></tr> </thead> <tbody> <tr><td>-2</td><td>-5</td></tr> <tr><td>-1</td><td>-3</td></tr> <tr><td>0</td><td>-1</td></tr> <tr><td>1</td><td>1</td></tr> </tbody> </table></td> <td>8</td> <td>-3</td> <td></td> </tr> <tr> <td></td> <td>10</td> <td>-4</td> <td></td> </tr> </table>	$f(x) = \frac{2}{3}x + 1$	x	y			2	0	$f(x) = -3x - 1$		4	-1	$f(x) = -\frac{1}{2}x + 1$		6	-2	$f(x) = 2x - 1$	<table border="1" data-bbox="1192 1671 1292 1860"> <thead> <tr><th>x</th><th>y</th></tr> </thead> <tbody> <tr><td>-2</td><td>-5</td></tr> <tr><td>-1</td><td>-3</td></tr> <tr><td>0</td><td>-1</td></tr> <tr><td>1</td><td>1</td></tr> </tbody> </table>	x	y	-2	-5	-1	-3	0	-1	1	1	8	-3			10	-4

Filling and Wrapping:	<p>Surface Area of a Rectangular Prism</p>																																			

CMP3 Unit	Integrated Computing Lessons that can extend the CMP3 Unit																							
<p><i>Three-Dimensional Measurement</i></p>	<ul style="list-style-type: none"> This lesson engages students in analyzing a rectangular prism to identify which dimensions are needed to find the area of each face. Simple code generates a printable set of rectangles labeled with dimensions. Students use printouts to construct paper models of their prisms and calculate the surface area. Ultimately, students can use their model to generate a formula for calculating the surface area of a prism. 	<div style="border: 1px solid black; padding: 5px; width: fit-content; margin-bottom: 5px;">180x340</div> <div style="display: flex; justify-content: space-between; width: 100%;"> <div style="border: 1px solid black; padding: 5px; width: 60%;">180x340</div> <div style="border: 1px solid black; padding: 2px; font-size: small;">50x180</div> </div> <div style="display: flex; justify-content: space-between; width: 100%; margin-top: 5px;"> <div style="border: 1px solid black; padding: 2px; font-size: x-small;">50x340</div> <div style="border: 1px solid black; padding: 2px; font-size: x-small;">50x340</div> </div>																						
<p>Samples and Populations: <i>Making Comparisons and Predictions</i></p>	<p><u>Probability, Inference, and Sample Size</u></p> <ul style="list-style-type: none"> Simple code allows students to quickly generate samples of various sizes from any dataset. In seconds, students can generate pie charts to see how the samples compare to each other and use them to make predictions about the full dataset. Students can test their predictions against findings from the full dataset. 	<div style="border: 1px solid gray; padding: 5px;"> <p>pie-chart(tiny-sample, "s")</p>  <table border="1" style="font-size: x-small; margin-top: 5px;"> <caption>Data for tiny sample</caption> <tr><th>Animal</th><th>Percentage</th></tr> <tr><td>cat</td><td>40%</td></tr> <tr><td>dog</td><td>40%</td></tr> <tr><td>lizard</td><td>10%</td></tr> <tr><td>tarantula</td><td>10%</td></tr> </table> </div> <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>pie-chart(large-sample, "s")</p>  <table border="1" style="font-size: x-small; margin-top: 5px;"> <caption>Data for large sample</caption> <tr><th>Animal</th><th>Percentage</th></tr> <tr><td>cat</td><td>32%</td></tr> <tr><td>dog</td><td>34%</td></tr> <tr><td>lizard</td><td>18%</td></tr> <tr><td>tarantula</td><td>8%</td></tr> <tr><td>rabbit</td><td>6%</td></tr> </table> </div>	Animal	Percentage	cat	40%	dog	40%	lizard	10%	tarantula	10%	Animal	Percentage	cat	32%	dog	34%	lizard	18%	tarantula	8%	rabbit	6%
